# VOLCANIC WATER

## > SOURCE AND PURITY

Extremely pure and distinctly different, volcanic water is drawn from deep inside the lush, green ancient volcanoes of the Auvergne in France.

Volcanic water is created by rainwater that seeps very slowly through porous layers of volcanic rocks, over 100 meters thick, that act as a natural filter and also give the water its unique characteristics and mineral composition.

# VOLCANIC WATER

## > PURE NATURE

The spring of the volcanic water is deep below the volcano and the water is caught directly there. The purity of the water is also due to the protected environment of the volcanic area that is free from industry and intensive farming.

# VOLCANIC WATER

## > GEOLOGICAL FACTS

A volcano is an opening, or rupture, in a planet's surface or crust, which allows hot, molten rock, ash, and gases to escape from below the surface. Volcanic activity involving the extrusion of rock tends to form mountains or features like mountains over a period of time.

Lava is molten rock expelled by a volcano during an eruption.
